Understanding .NET Interfaces

Presented by Jeremy Clark
www.jeremybytes.com

What are Interfaces?

Interfaces describe a group of related functions that can belong to any class or struct.

Public set of members:

- Properties
- Methods
- Events
- Indexers

Differences

Abstract Classes

- May contain implementation code
- A class may only descend from a single base class
- Members contain access modifiers
- May contain fields, properties, constructors, destructors, methods, events and indexers

Interfaces

- May not contain implementation code
- A class may implement any number of interfaces
- Members are automatically public
- May contain properties, methods, events, and indexers (not fields, constructors or destructors)

Various Data Sources

Microsoft SQL Server

CSV

Oracle

JSON

WebAPI

MongoDB

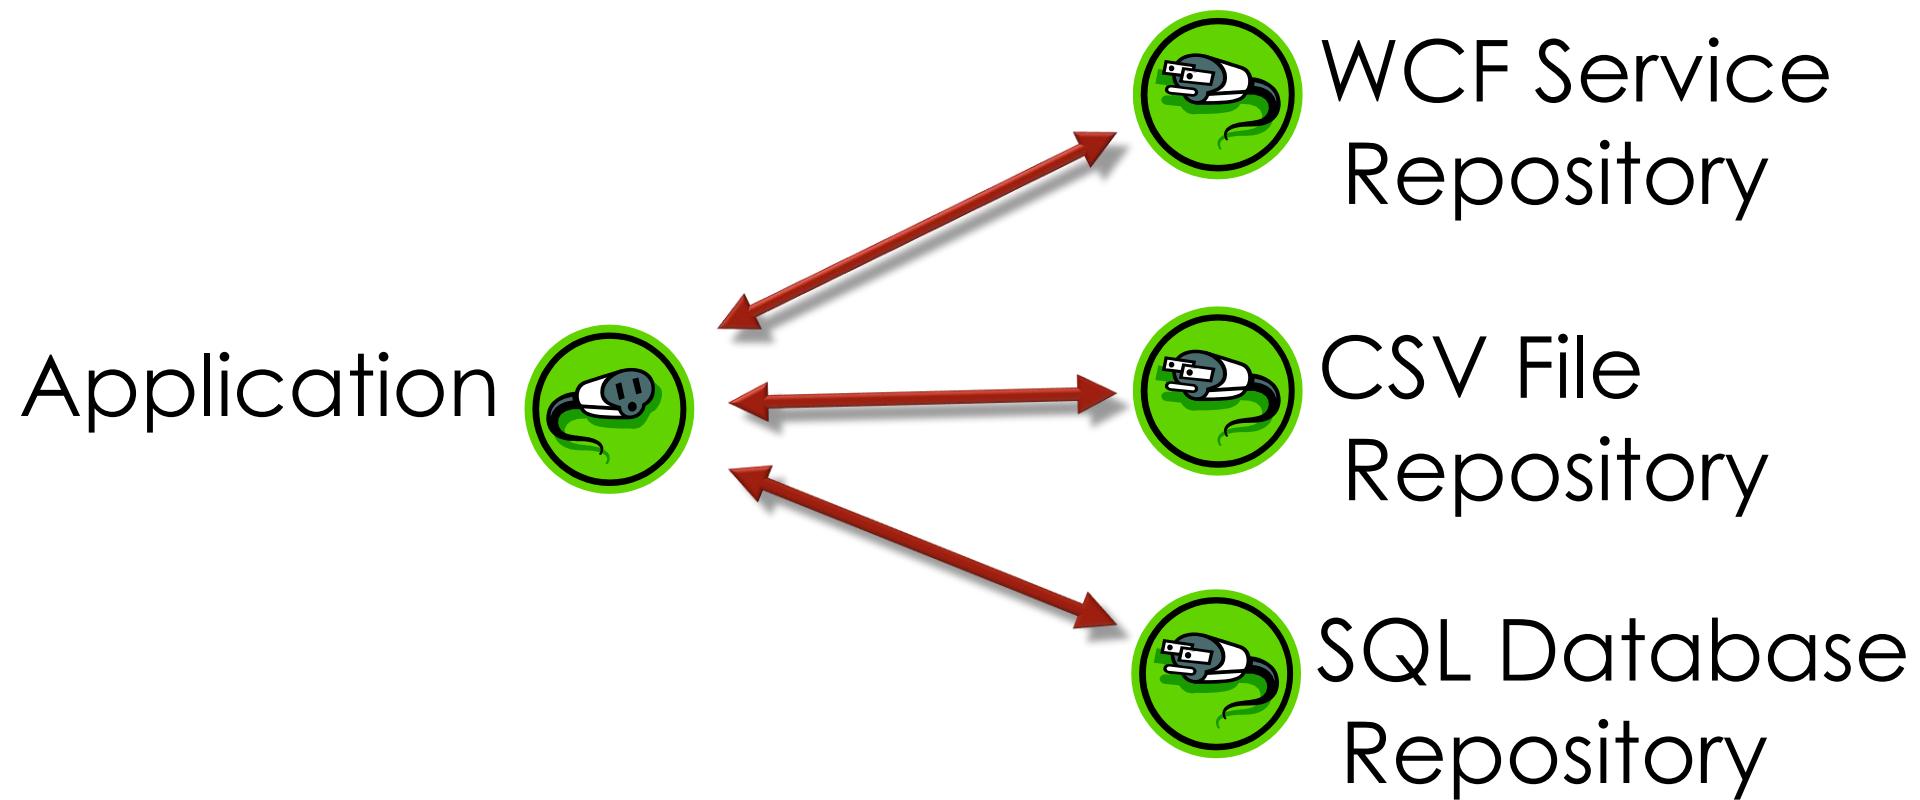

SOAP Service

Amazon AWS

Hadoop

Microsoft Azure

Pluggable Repositories

Simple Repository

Create

Read

Update

Delete

Repository Interface

```
public interface IPersonRepository
{
    C void AddPerson(Person newPerson);
    R IEnumerable<Person> GetPeople();
    Person GetPerson(string lastName);
    U void UpdatePerson(string lastName,
        Person updatedPerson);
    void UpdatePeople(IEnumerable<Person>
        updatedPeople);
    D void DeletePerson(string lastName);
}
```

Differences

Abstract Classes

- May contain implementation code
- A class may only descend from a single base class
- Members contain access modifiers
- May contain fields, properties, constructors, destructors, methods, events and indexers

Interfaces

- May not contain implementation code
- A class may implement any number of interfaces
- Members are automatically public
- May contain properties, methods, events, and indexers (not fields, constructors or destructors)
